

# Learn Asp.Net Core Web API

## Versioning via URL Path

### Step 1:

First, you will need to install the nugget package named as Aspnetcore.Versioning

### Step 2:

Open the startup.cs file and in the configure service methods let's add

```
services.AddApiVersioning();
```

Then this configure service method will look this this one...

```
public void ConfigureServices(IServiceCollection services)
{
    services.AddMvc();
    services.AddApiVersioning();
}
```

### Step 3:

Then go to the controller where you want to add the version number and simply on top of controller just add

```
[ApiVersion("1.0")]
```

Then you need to set your route like this...

```
[Route("api/v{version:apiVersion}/movies")]
```

**We just need to call the URL in the following format**

http://localhost:56861/api/v1/movies

http://localhost:56861/api/v2/movies
