# Learn Asp.Net Core Web Api

Api Documentation

Step 1:

First you'll need to install the nugget package named as swashbuckle.aspnetcore

Step 2:

Open the startup.cs file and in the configure service methods let's change your configure service method to this one...

```csharp
public void ConfigureServices(IServiceCollection services)
    {
        services.AddMvc();

        services.AddSwaggerGen(c =>
        {
         c.SwaggerDoc("v1", new Info { Title = "Products Api", Version = "v1" });
        });

    }
```

Step 3:

Then go to the Configure method and simply add the following lines of code...

```csharp
        app.UseSwagger();

        app.UseSwaggerUI(c =>
        {
            c.SwaggerEndpoint("/swagger/v1/swagger.json", "Api for Products");

        });
```

After this your code will look like this

```csharp
public void Configure(IApplicationBuilder app, IHostingEnvironment env)
    {
        if (env.IsDevelopment())
        {
            app.UseDeveloperExceptionPage();
        }
        app.UseSwagger();

        app.UseSwaggerUI(c =>
        {
            c.SwaggerEndpoint("/swagger/v1/swagger.json", "Api for Products");

        });
        app.UseMvc();
    }
```
